Between the standard view used throughout the project via Chrome, and Safari, I didn't find all too many differences. The two rendered the fonts, images, colors, and links very similarly, although the Safari browser was unable to render my webpage's favicon element. Next, I viewed the webpage(s) through Firefox, and again, noticed very few differences from the "original" browser, Chrome. Although unlike Safari, Firefox was able to render the favicon into the tab. Overall, the three web browsers performed very similarly, with only Safari being unable to load an element in (favicon).
